

MINAB Pac[®]

Packaging machines

Manual packing stations.

Relieves manual lifting and provides more rational handling.

The packing stations are available in different degrees of automation.

The packaging is sorted out on a packing table in your prescribed packaging pattern.
If the table becomes full a signal is given, which can be used to stop other machines.
This makes a person free to perform more than just the packaging work.

The packing stations tailor systems according to your requirements.

Different grasping tools are available for diverse packaging, e.g. bottles, drums, cans, bags, sacks.

In order to be able to give you a quotation we need information about:
number of packaging types, packing patterns, weights, cartons and layout sketch

The images show a packing station for bottles.

The bottles are fed onto the table according to the packaging pattern.

The grasping tool can be quickly changed out for different formats.

The lifting arm assumes all of the weight during the lifting process.

The packing position is fixed.

Worth noting.

With the current solution, the operator has also been relieved of lifting: 8500 kg / day
